Le Larousse des 500 pourquoi comment - Les Dinosaurés Turtleback

Pourquoi les dinosaurés, qui détiennent - et de très loin le record de longévité sur notre planète, ont-ils soudainement disparu il y a 65 millions d'années ? A cette question, qui intrigue depuis

longtemps le chercheur aussi bien que l'homme de la rue, de multiples réponses ont été apportées : drame écologique, extinction due à une évolution naturelle, catastrophe d'origine volcanique ou cosmique. Cette dernière hypothèse, celle de l'impact d'un astéroïde ayant pour conséquence d'obscurcir durablement l'atmosphère et de provoquer une extinction d'espèces sans précédent, s'est vue confortée il y a quelques années par la découverte, sur la côte du Mexique, d'un cratère fossile de près de 200 km de diamètre. A mi-chemin entre roman policier et article scientifique, ce récit retrace les péripéties de la découverte du cratère de Chicxulub et analyse les controverses qu'elle a suscitées.

The Rise and Fall of the Dinosaurés W H Freeman & Company

Il y a 65 millions d'années, une comète ou une météorite plus grosse que l'Everest percuta violemment la Terre, provoquant une explosion égale à la détonation d'une centaine de millions de bombes H. Le projectile vaporisé et les débris du point d'impact se répandirent dans l'atmosphère, avant de retomber tout autour du globe terrestre. Les conséquences furent désastreuses pour l'environnement : un gigantesque raz-de-marée, des incendies à l'échelle des continents, une obscurité glaciale, suivie par une terrible chaleur de serre. Quand la Terre revint à des conditions normales, la moitié des plantes et des animaux qui vivaient à la surface du globe avaient péri à jamais. Cette catastrophe apparaît désormais comme la réponse la plus vraisemblable à l'une des grandes énigmes de la science : pourquoi les dinosaurés se sont-ils éteints ? Walter Alvarez est un de ceux qui ont levé le mystère. Il raconte ici les aléas de l'enquête scientifique : une aventure étonnante, un passionnant récit.

"THE ULTIMATE DINOSAUR BIOGRAPHY," hails Scientific

American: A thrilling new history of the age of dinosaurs, from one of our finest young scientists. "A masterpiece of science writing." —Washington Post A New York Times Bestseller •

Goodreads Choice Awards Winner • A BEST BOOK OF THE YEAR:

Smithsonian, Science Friday, The Times (London), Popular Mechanics, Science News "This is scientific storytelling at its most visceral, striding with the beasts through their Triassic dawn, Jurassic dominance, and abrupt demise in the Cretaceous."

—Nature The dinosaurs. Sixty-six million years ago, the Earth's most fearsome creatures vanished. Today they remain one of our planet's great mysteries. Now *The Rise and Fall of the Dinosaurs* reveals their extraordinary, 200-million-year-long story as never before. In this captivating narrative (enlivened with more than seventy original illustrations and photographs), Steve Brusatte, a young American paleontologist who has emerged as one of the foremost stars of the field—naming fifteen new species and leading groundbreaking scientific studies and fieldwork—masterfully tells the complete, surprising, and new history of the dinosaurs, drawing on cutting-edge science to dramatically bring to life their lost world and illuminate their enigmatic origins, spectacular flourishing, astonishing diversity, cataclysmic extinction, and startling living legacy. Captivating and revelatory, *The Rise and Fall of the Dinosaurs* is a book for the ages. Brusatte traces the evolution of dinosaurs from their inauspicious start as small shadow dwellers—their

beneficiaries of a mass extinction caused by volcanic eruptions at the beginning of the Triassic period—into the dominant array of species every wide-eyed child memorizes today, T. rex, Triceratops, Brontosaurus, and more. This gifted scientist and writer re-creates the dinosaurs' peak during the Jurassic and Cretaceous, when thousands of species thrived, and winged and feathered dinosaurs, the prehistoric ancestors of modern birds, emerged. The story continues to the end of the Cretaceous period, when a giant asteroid or comet struck the planet and nearly every dinosaur species (but not all) died out, in the most extraordinary extinction event in earth's history, one full of lessons for today as we confront a "sixth extinction." Brusatte also recalls compelling stories from his globe-trotting expeditions during one of the most exciting eras in dinosaur research—which he calls "a new golden age of discovery"—and offers thrilling accounts of some of the remarkable findings he and his colleagues have made, including primitive human-sized tyrannosaurs; monstrous carnivores even larger than T. rex; and paradigm-shifting feathered raptors from China. An electrifying scientific history that unearths the dinosaurs' epic saga, *The Rise and Fall of the Dinosaurs* will be a definitive and treasured account for decades to come. Includes 75 images, world maps of the prehistoric earth, and a dinosaur family tree.

The Dinosaur Extinction Cambridge University Press

In *The Last Days of the Dinosaurs*, Riley Black walks readers through what happened in the days, the years, the centuries, and the million years after the impact, tracking the sweeping disruptions that overtook this one spot, and imagining what might have been happening elsewhere on the globe. Life's losses were sharp and deeply-felt, but the hope carried by the beings that survived sets the stage for the world as we know it now. Picture yourself in the Cretaceous period. It's a sunny afternoon in the Hell Creek of ancient Montana 66 million years ago. A *Triceratops horridus* ambles along the edge of the forest. In a matter of hours, everything here will be wiped away. Lush verdure will be replaced with fire. *Tyrannosaurus rex* will be toppled from their throne, along with every other species of non-avian dinosaur no matter their size, diet, or disposition. They just don't know it yet. The cause of this disaster was identified decades ago. An asteroid some seven miles across slammed into

the Earth, leaving a geologic wound over 50 miles in diameter. In the terrible mass extinction that followed, more than half of known species vanished seemingly overnight. But this worst single day in the history of life on Earth was as critical for us as it was for the dinosaurs, as it allowed for evolutionary opportunities that were closed for the previous 100 million years.

This 2005 edition of *The Evolution and Extinction of the Dinosaurs* is a unique, comprehensive treatment of this fascinating group of organisms. It is a detailed survey of dinosaur origins, their diversity, and their eventual extinction. The book can easily be used as a teaching textbook for a class, but it is also written as a series of readable, entertaining essays covering important and timely topics appealing to non-specialists and all dinosaur enthusiasts: birds as 'living dinosaurs', the new feathered dinosaurs from China, 'warm-bloodedness'. Along the way, the reader learns about dinosaur functional morphology, physiology, and systematics using cladistic methodology - in short, how professional paleontologists and dinosaur experts go about their work, and why they find it so rewarding. The book is spectacularly illustrated by John Sibbick, a world-famous illustrator of dinosaurs, commissioned exclusively for this book.
