Textbook of Family Medicine Elsevier Health Sciences
 THERE ARE OVER 43,000 OSTEOPATHIC physicians in the United States, providing a system of medical care based on a philosophy that the human body has self-healing abilities. In order to facilitate those abilities, the osteopathic doctor practices a "whole person" approach. While the goal of traditional medical doctors is to treat specific symptoms, osteopathic physicians concentrate on treating the patient as a whole. It is important to make this distinction. Osteopaths, who are trained outside the United States are not physicians. Their practice is limited to non-invasive manual therapies, including touch, physical manipulation, stretching and massage to increase the mobility of joints, to relieve muscle tension, and to help energize the body's own healing mechanisms. Those trained in the United States are known as osteopathic physicians (or Doctors of Osteopathy or DOs), and they practice the entire scope of modern medicine. They receive all the training and provide the same healthcare

services as medical doctors (MDs). DOs understand how all the body's systems are interconnected and how each one affects the others. They are trained to identify and correct structural problems, which can assist the body's natural tendency toward health and self-healing. They also help patients develop attitudes and lifestyles that help prevent disease. Those who choose a career in osteopathic medicine are people who value taking a holistic approach to healing. As society shifts towards a greater understanding of what makes us sick and what our bodies are capable of, osteopathic physicians are seeing an increase in the number of patients they see. Osteopathy in the US is fully accepted as a mainstream medical career. Today, millions of Americans have chosen this type of individualized, compassionate care, and have made DOs their primary care physicians. In terms of training and education, osteopathic physicians (DOs) are actually indistinguishable from medical doctors (MDs). They are trained in similar schools, go through the same number of years, learn the procedures, and pass the same examinations. They have the same rights and privileges to practice medicine. The difference is in how they choose to treat the patient. When MDs might reach for the prescription pad, a DO

might prescribe a change of diet or environment instead. Like their MD colleagues, DOs can specialize in over a hundred different areas of practice. Because of their total-person philosophy, many gravitate to specialties in primary care fields such as family medicine, pediatrics, obstetrics, and emergency medicine. DOs are also specially trained in manual medicine for treatment of musculoskeletal disorders. This makes them uniquely qualified to specialize in rehabilitation and sports medicine. In fact, many DOs are employed as professional sports and college team physicians. DOs have an extensive scientific background. They must excel in science classes like biology, chemistry, and anatomy. They learn all of the traditional medical techniques, but they also receive additional training in muscular-skeletal manipulation. They also complete a residency in a specialty. Osteopathic physicians spend a significant amount of time and money on medical school, dedicating upwards of seven years of their life to study in some cases. As a result, they do have a higher-than-average median salary. Earnings can reach well into the six figures, making it quite an attractive job for compassionate individuals with a love of healing and science. There is a growing shortage of healthcare professionals in this country. This makes it an ideal time to get into the medical field, particularly the area of osteopathic medicine, which is set to see phenomenal growth throughout this upcoming decade.

Technological advances and the rise of collaborative, interdisciplinary approaches have changed the practice of research. The 21st century researcher not only faces the challenge of managing increasingly complex datasets, but also new data sharing requirements from funders and journals. Success in today's research enterprise requires an understanding of how to work effectively with data, yet most researchers have never had any formal training in data management. Libraries have begun developing services and programs to help researchers meet the demands of the data-driven research enterprise, giving librarians exciting new opportunities to use their expertise and skills. *The Medical Library Association Guide to Data Management for Librarians* highlights the many ways that librarians are addressing researchers' changing needs at a variety of institutions, including academic, hospital, and government libraries. Each chapter ends with "pearls of wisdom," a bulleted list of 5-10 takeaway messages from the chapter that will help readers quickly put the ideas from the chapter into practice. From theoretical foundations to practical applications, this book provides a background for librarians who are new to data management as well as new ideas and approaches for experienced data librarians.

Overcoming suspicion, ridicule, and outright opposition from the American Medical Association, the osteopathic medical profession today serves the health needs of more than thirty million Americans. Osteopathic medicine is now the fastest-growing segment of the US physician and surgeon population. In *The DOs*, historian Norman Gevitz chronicles the development of this controversial medical movement from its nineteenth-century origins in the American Midwest to the present day. He describes the philosophy and practice of osteopathy, as well as the impact of osteopathic medicine on health care. In print continuously since 1982, *The DOs* has now been thoroughly updated and expanded. From the theories underlying the use of spinal manipulation developed by osteopathy's founder, Andrew Taylor Still, Gevitz traces the movement's early success, despite attacks from the orthodox medical community. He also recounts the efforts of osteopathic medical colleges to achieve parity with institutions granting MD degrees and looks at the continuing effort by osteopathic physicians and surgeons to achieve greater recognition and visibility. Bringing additional light to the philosophical origins and practices of the osteopathic movement, as well as the historic debates about which degree to offer its graduates, this volume • chronicles the challenges the profession has faced in the early decades of the twenty-first century • addresses recent challenges to the osteopathic medical profession • explores efforts at preserving osteopathy's autonomy and distinctiveness • offers a new perspective on the future of osteopathic medicine Based on an extensive examination and evaluation of primary sources, as well as countless interviews with individuals both inside and outside osteopathic medicine, *The DOs* is the definitive history of the osteopathic medical profession.

The author writes in the film-noir style as seen in the old black-and-white movies from the '40s and '50s. There is always a MacGuffin or plot device that drives the story. In the case of his book, the author used potential threats to himself or to his wife to accomplish his goal.

The Merger: M.D.s and D.O.s in California If you are interested in the recent history of the medical professions, this book is for you. If personal narratives of historical events speak to you as a second layer of documentation, this book is for you. If you are aware that in America there exist two separate yet equal, fully licensed physicians, M.D.s and D.O.s, you might be interested in learning about their unique relationship in California. If you know little about D.O.s, this book will give you a picture of their approach to patient care and to their M.D. colleagues. The osteopathic profession in California has a unique history, as it differs dramatically from the professions history in the rest of the nation. More than 100 years ago, a small pioneering group of osteopathic physicians established in Southern California the Pacific School of Osteopathy to graduate physicians and surgeons with the ability to acquire an unlimited license. Since then, the educational, research, and regulatory arenas of osteopathy have seen in California low points of near elimination and high points of recognition. Cultures are based on firm beliefs in the truth of their understanding of the world. Often they collide with those who respect different truths. Similarly, the medical culture in California went through collisions between osteopathic and allopathic medicine, often in response to competition and antagonism. Which values and beliefs about each others profession were held so fervently in California that prompted the unique event of absorbing the osteopathic profession into allopathic mainstream medicine? This project explores the events, unique to California but with repercussions nation-wide, of a merger between osteopathic and allopathic medicine. In 1962, the relatively small medical organization of fully licensed osteopathic physicians (the California Osteopathic Organization) merged with the much larger mainstream medical profession (the California Medical Association). What were the incentives for a fully licensed parallel healthcare profession to forfeit its identity

and philosophy? What key players and leaders emerged? How did the individual practicing physician think and feel about the merger? While about two thousand osteopathic physicians changed to the M.D. degree, about two hundred California D.O.s did not merge but persevered in their battle to restore the licensing power of their profession in California. What social and personal motivational sources sustained this group for over a decade? How has osteopathy's unique history affected medical education and professional relations, nation-wide and internationally? Answers to these questions have emerged in historical narratives by key persons figuring in the events. Most of them have not written about their lives and their social and political surroundings at the time of the merger and its repercussions. Many never learned the long-term outcomes of their endeavors. Our multidisciplinary research team transcribed in-depth interviews to capture the thoughts and feelings among individuals who played significant roles from the 1940s to the 70s. With the approval of the Institutional Review Board of the University of California, Irvine for the protection of the participants' rights, we asked a diverse group, 35 in all, of physicians, administrators, lawyers and lobbyists, to provide their historical narratives and their suggestions for future directions. Our objective has been to give an unbiased account, listening equally to representatives of allopathy, osteopathy, and politics. Inspired by Dr. Gevitz's cogent academic analysis of osteopathic medicine in America, this book presents personal perceptions of events, integrated with documented descriptions, stored in archives, to facilitate the readers' understanding and analysis. The work has been based on the assumption
