Excerpt from Ransome Concrete Machinery Company This handbook of concrete machinery illustrates and describes in some detail the machinery manufactured by the Ransome Concrete Machinery Co. The main line of this machinery is of course the Ransome non-tilting batch concrete mixer, which is explained in all its details of dimensions, capacities, weights, etc. The Ransome Mixer, however, is only one of a long list of devices, apparatus, and tools manufactured by this firm for mixing concrete, for handling concrete and concrete materials, for depositing and compacting concrete and for finishing concrete surfaces. These other devices and tools are, like the Ransome Mixers, illustrated and described in detail. Features of the book,

on which some stress is laid, are the technical discussions of different types of mixers, the descriptions of labor and cost saving methods, and the exact and careful descriptions of the various devices and methods used in practical operation. No firm whose activities in the field of concrete engineering are so broad in scope, or whose experience in manufacturing and using concrete and concrete machinery is of such long standing as are the activities and experience of this firm, can give in a catalog more than a fragment of the information in its possession. To all who do not find their query answered and their problem solved in this handbook we extend a cordial invitation to write us for further information. The purpose of this investigation was to evaluate the effectiveness of a 4-1/2-cu-yd-capacity, stationary-drum concrete mixer with a spiral blade being used by the U.S. Army Engineer District, St. Louis, to mix concrete for the spillway at Shelbyville Dam. Batches of four concrete mixtures were mixed, sampled, and tested for coarse aggregate content, unit weight of air-free mortar, and water and cement content of the mortar. Test results for concrete having a slump of 2-1/2 plus or minus 1 in. indicated that the mixer would satisfactorily mix 4 cu yd of 3-in., or smaller, maximum-size-aggregate concrete and 3 cu yd of 6-in. maximum-size-aggregate concrete in either 2 or 1-1/2 minutes. One-minute mixing time was insufficient to blend the constituents into a uniform mass. Two-minute mixing did not give satisfactory mixing for relatively harsh mixtures (1-1/4-in. slump or less). Tests in accordance with the Corps of Engineers 'Method of Test for Concrete Mixer Performance' (CRD-C 55) were made on a new 16-cu-ft-capacity, laboratory, tilting concrete mixer to determine its suitability for mixing concrete containing aggregate up to 6 in. in size, and structural concrete of high cement content. Three mixtures with aggregates graded up to 6 in., 3 in., and 3/8 in., respectively, were used in the evaluation. Each mixture was evaluated individually. Results indicated that the mixer would blend the constituents into a uniform mixture if the charging and mixing procedures developed in this investigation are used for each type of mixture.
