Although mammography is the primary method used for breast cancer screening, screening mammography is limited especially in women with dense breasts, which includes nearly 50% of all women in the United States. Despite improvements such as digital mammography, computed aided detection, and digital breast tomosynthesis, breast cancer continues to be a leading cause of cancer-related death in women. The recent proliferation of breast ultrasound has led to increased health care costs and false positives, with only a slight improvement in breast cancer detection. It is time for a better test. This is the first textbook dedicated to the subject of abbreviated breast MRI (AB-MR). The editors are principal investigators in the first multicenter trial evaluating AB-MR. Each chapter is authored by a leading expert in the field of breast MRI. AB-MR only takes 10 minutes or less to perform, has a comparable cost to screening breast ultrasound, and detects twice as many cancers compared to combined screening with mammography and ultrasound. The improved performance

of AB-MR is irrespective of breast density, family history, overall breast cancer risk, and cancer characteristics (e.g. type, staging, invasive or intraductal, primary or recurrent). As such, it will likely become a routine screening tool in women with dense breasts.

Key Features
 A background on breast MR imaging including a review of current research data
 Fundamental guidelines for implementing, performing, and interpreting AB-MR
 Technical approaches with proven efficacy, including biopsy methods
 Accurate interpretation presented in an easy-to-read flow chart format
 More than 250 high quality color illustrations
 AB-MR has the potential to help radiologists overcome breast cancer screening limitations and change current standards of practice. This book provides radiologists with the necessary tools to quickly incorporate AB-MR into clinical practice, with an ultimate goal of improved breast cancer detection rates and patient outcomes.

Music therapy is recognised as being applicable to a wide range of healthcare and social contexts. Since the first edition of Music Therapy: An art beyond words, it has extended into areas of general medicine, mainstream education and community practice. This new edition revises the historical and theoretical perspectives and recognises the growing

evidence and research base in contemporary music therapy. Leslie Bunt and Brynjulf Stige document the historical evolution of music therapy and place the practice within seven current perspectives: medical, behavioural, psychoanalytical, humanistic, transpersonal, culture-centred and music-centred. No single perspective, individual or group approach is privileged,

although the focus on the use of sounds and music within therapeutic relationships remains central. Four chapters relate to areas of contemporary practice across different stages of the lifespan: child health, adolescent health, adult health and older adult health. All include case narratives and detailed examples underpinned by selected theoretical and research

perspectives. The final two chapters of the book reflect on the evolution of the profession as a community resource and the emergence of music therapy as an academic discipline in its own right. A concise introduction to the current practice of music therapy around the world, Music Therapy: An art beyond words is an invaluable resource for professionals in music therapy and

music education, those working in the psychological therapies, social work and other caring professions, and students at all levels. Atlas of Nuclear Cardiology Springer Science & Business Media MRI of the Musculoskeletal System, Sixth Edition, comprehensively presents all aspects of MR musculoskeletal imaging, including basic principles of

interpretation, physics, and terminology before moving through a systematic presentation of disease states in each anatomic region of the body. Its well-deserved reputation can be attributed to its clarity, simplicity, and comprehensiveness. The Sixth Edition features many updates, including: New pulse sequences and artifacts in the basics chapters Over 3,000 high-quality images including new anatomy

drawings and images FREE access to a companion web site featuring full text as well as an interactive anatomy quiz with matching labels of over 300 images. *Artifacts and Technical Solutions in MR Diagnostic Imaging* Independently Published This highly comprehensive and informed textbook has been prepared by the Cardiovascular Magnetic Resonance section of the European Society of

Cardiology association on imaging, the EACVI. The EACVI Textbook of Cardiovascular Magnetic Resonance is the authority on the subject. The textbook is aligned with ESC Core Curriculum and EACVI Core Syllabus for CMR. It is a practical resource and provides a disease orientated outlook on the subject. Structured with thirteen clear and detailed sections, ranging from

Physics to Methodology, and featuring specific sections on ischemic heart disease, myocardial disease, pericardial disease, and congenital heart disease and adult congenital heart disease, The EACVI Textbook of Cardiovascular Magnetic Resonance provides extensive knowledge across the entire subject area in CMR. Beautifully illustrated and physical principles enriched with

schematic animations, the textbook is advanced further with key video content based on clinical cases. Written by leading experts in the field from across the world, the textbook aims to summarise the existing research and clinical evidence for the various CMR indications and provide an invaluable resource for cardiologists and radiologists across the board. The textbook is

ideal for cardiologists and radiologists new to the field of Cardiovascular Magnetic Resonance, those preparing for ESC certification in CMR, and those established in the field wishing to gain a deep understanding of CMR. Online access to the digital version is included with purchase of the print book, with accompanying videos referenced within the text available on

It is the main determinant of relapse, hospitalization, symptom persistence, and poor psychosocial functioning and outcome. Adherence to treatment is affected by various factors related to the

disease characteristics, to the patient himself or herself, to the treatment, and to the therapeutic relationship. Some of these factors are modifiable, and both pharmacological and non-pharmacological strategies have been developed for this purpose. This book addresses the different aspects of adherence to treatment in schizophrenia and related disorders in a systematic but easy-to-use manual

format. Chapters focus on a full range of issues, including pharmacological and non-pharmacological strategies to enhance adherence and continuity of care, relevant psychological factors, the importance of the patient-doctor relationship, and the need for an alliance with other care-givers. Adherence to Antipsychotics in Schizophrenia will be an invaluable asset for all

who are involved in the care of patients with schizophrenia.

 Deimination is a relatively new post-translational modification of proteins, whose recognition is ever-increasing. First linked to the pathology of rheumatoid arthritis (RA), deimination is a process by which selected positively charged arginine

amino acids are converted to neutral citrulline amino acids by the peptidyl arginine deiminase (PAD) family of enzymes. Although the medical literature is rich with articles about the possible significance of deiminated proteins in RA, Protein Deimination in Human Health and Disease is the first publication to compile this knowledge and the growing amount of new

information now known about the presence of deiminated proteins in the eye, skin, hair, gums, lung and nervous system, as well. As a result, this process has now been linked to numerous additional conditions besides RA, including cancer, glaucoma, Alzheimer's disease, Parkinson's disease, multiple sclerosis, spinal cord and peripheral nerve injury, Creutzfeldt-

Jakob disease, among many others. Chronicling the earliest studies of deimination up to the present, this volume distills what is currently known about citrullination of proteins in the human body and is the first book of its kind on the topic. The EACVI Textbook of Cardiovascular Magnetic Resonance Oxford University Press Perhaps the most important achievements

in the field of epileptology in the past two decades have been in the neuroimaging and genetic breakthroughs as applied to patients with epilepsy. Indeed, neuroimaging has become a vital part in the study of epilepsy, affecting broad aspects of the disorder ranging from diagnosis and classification to treatment and prognosis. Neuroimaging in epilepsy encompasses many different approaches that have reached

various levels of expertise across epilepsy centers worldwide. This book discusses every imaging modality used to gather information on epilepsy. Each technique is described by world experts and epilepsy centers worldwide. *A History of Epidemiologic Methods and Concepts* Elsevier Health Sciences Patient engagement should be envisaged as a key priority today to

innovate healthcare services delivery and to make it more effective and sustainable. The experience of engagement is a key qualifier of the exchange between the demand (i.e. citizens/patients) and the supply process of healthcare services. To understand and detect the strategic levers that sustain a good quality of patients' engagement may thus allow not only

to improve clinical outcomes, but also to increase patients' satisfaction and to reduce the organizational costs of the delivery of services. By assuming a relational marketing perspective, the book offers practical insights about the developmental process of patients' engagement, by suggesting concrete tools for assessing the levels of patients' engagement

and strategies to sustain it. Crucial resources to implement these strategies are also the new technologies that should be (1) implemented according to precise guidelines and (2) designed according to a user-centered design process. Furthermore, the book describes possible fields of patients' engagement application by describing the best practices and experiences matured in

different fields

 This book explores various and distinct aspects of environmental health literacy (EHL) from the perspective of investigators working in this emerging field and their community partners in research. Chapters aim to distinguish EHL from

health literacy and environmental health education in order to classify it as a unique field with its own purposes and outcomes. Contributions in this book represent the key aspects of communication, dissemination and implementation, and social scientific research related to environmental health sciences and the range of expertise and interest in EHL. Readers will learn

about the conceptual framework and underlying philosophical tenets of EHL, and its relation to health literacy and communication research. Special attention is given to topics like dissemination and implementation of culturally relevant environmental risk messaging, and promotion of EHL through visual technologies. Authoritative entries by experts also

focus on important approaches to advancing EHL through community-engaged research and by engaging teachers and students at an early age through developing innovative STEM curriculum. The significance of theater is highlighted by describing the use of an interactive theater experience as an approach that enables community residents to express themselves in

non-verbal ways.

This book is for all those professionals directly or indirectly working in magnetic resonance, and arises from the need to have available a complete and comprehensible guide, in order to recognize, construe and work out almost all the artifacts that can currently be observed in the supplied scanners, being low-field, mid-field, high-field or ultra-high-field. The content includes many

demonstrative images and few mathematical formula, moreover simple to be construed, in order to make easily comprehensible the complex mechanisms hidden behind MR Physics, connected to the artifact under consideration. The text presents a basic introduction to the magnetic resonance and a glossary of used acronyms, so that the principles related to k-space,

impulse sequences and relaxation times are clearly understood. Artifacts are effectively classified in chapters and subchapters, according to the underlying cause generating them. Each artifacts group is dealt with following a logic providing for: -
