This book assembles into one volume summaries of school-based intervention research that relates to those who deal on a regular basis with the growing body of students having high-incidence learning disabilities and/or behavior disorders: special educators, school psychologists, and clinical child psychologists. Chapter authors begin with an overview of their topic followed by a brief section on historical perspectives before moving on to the main section – a critical discussion of empirically based intervention procedures. In those instances where evidence-based prescriptions can legitimately be made, authors discuss best practices and the conditions (e.g., classroom environment, teacher expertise) under which these practices are most effective. A final section deals with policy issues.

Of the many issues facing special education (and general education) today, it is difficult to imagine one more important or timely than response to intervention (RTI). Almost overnight RTI has become standard practice across the nation. Unfortunately, RTI remains ill-defined, falls far short of its evidence-based practice goal, is almost invariably misused, and often results in more harm than good. Nevertheless, as a conceptual framework RTI has great potential for ensuring that students with disabilities receive appropriate, evidence-based instruction. The mission of this handbook is to present a comprehensive and integrated discussion of response to intervention (RTI) and its relation to multi-tiered systems of support (MTSS) in both special education and general education. Although the two terms are currently used interchangeably, distinct differences exist between them. Therefore, chapters are dedicated to distinguishing the two concepts—RTI and MTSS—and describing each one’s unique role in both general and special education. In addition, the authors recommend a third term, Multi-Tiered Instruction, to differentiate the practices related to the purpose of the specific intervention.
