bodies. Practicing yoga,
as pictured here, is a
good example of the
voluntary use of the
muscular system. (credit:

Dmitry Yanchylenko) Introduction to the Muscular System | Anatomy and Physiology | The muscular system is made up of specialized cells called muscle fibers. Their main function is contractibility. Muscles, connected to bones or internal organs and blood vessels, are in charge for movement. Muscular System Anatomy and Physiology - Nurseslabs The muscular system is composed of, well, muscles! But don't let this trick you - there are approximately 639 muscles in the human body. As a nurse, you can't expect yourself to know the names of each of the hundreds of muscles so you can take care of a patient with myasthenia gravis or any other muscular disorder. Instead, you have to know the basic anatomy of each of the three types of muscles, what their functions are and the names of the major muscles in the body. Anatomy And Physiology: Muscular System Summary of Muscular system anatomy and physiology The main types of muscle tissue are: skeletal, cardiac and smooth muscles. Skeletal muscles can be moved voluntarily and are

important for maintaining body temperature, by generating heat. The cardiac muscle is present only in the heart and can contract without neural stimulation. Muscular system anatomy and physiology: Video | Osmosis Anatomy and Physiology Muscular System 1. Muscular System 2. Types of Muscle • Skeletal - striated & voluntary • Smooth - involuntary • Cardiac - heart 3. Muscles and Muscle Fibers Muscles are composed of many fibers that are arranged in bundles called FASCICLES Individual... 4. Muscle Layers 5. ...
