2001: A Space Odyssey combines meticulous science, limitless imagination, and pure visual majesty. This compendium, previously available as a Collector's Edition, contains photographs, pre-production paintings, and conceptual designs that explore the genius behind the sci-fi classic that remains the benchmark for all cinema space epics.

The author sets out to capture Picasso's early life in this biography, exploring the originality of his art and ambition. At the heart of the interpretation is Picasso's first great love, Fernande Olivier, with whom the artist lived for seven years - a period which included his most revolutionary works. Fernande is given her own voice by way of excerpts from her candid memoirs. Including the artist's friendships with Apollinaire and Gertrude Stein, the book evokes the atmosphere of bohemian life in Paris in the early 1900s.

The study of dark matter, in both astrophysics and particle physics, has emerged as one of the most active and exciting topics of research in recent years. This book reviews the history

behind the discovery of missing mass (or unseen mass) in the Universe, and ties this into the proposed extensions to the Standard Model of Particle Physics (such as Supersymmetry), which were being proposed within the same time frame. This book is written as an introduction to these problems at the forefront of astrophysics and particle physics, with the goal of conveying the physics of dark matter to beginning undergraduate majors in scientific fields. The book goes on to describe existing and upcoming experiments and techniques, which will be used to detect dark matter either directly or indirectly.

An unexpected collection from Norman Mailer—a book of his selected poems and more than one hundred of his drawings, most of them never before published. *Modest Gifts* is full of what the author calls “casual pleasures”—witty, naughty, and surprisingly tender verse and art. Lust, seduction, betrayal, jealousy, and even the banality of cocktail party chatter are depicted with humor, affection, and, above all, honesty. Here is an aspect of Norman Mailer unknown to many: lighthearted, prankish, whimsical, and often gentle, playfully sketching the intimate urban world that surrounds us. Modest, funny, and true, each poem and drawing shows a new side of one of the greatest writers of our time.

In 1973, Norman Mailer published 'Marilyn', his celebrated in-depth account of the life of Marilyn Monroe, as a glossy, fully illustrated coffee-table tome. Now, it has been made available in an accessible mass-market paperback edition.

During the War of the Rebellion, a new and influential club was established in the city of Baltimore in the State of Maryland. It is well known with what

energy the taste for military matters became developed among that nation of ship-owners, shopkeepers, and mechanics. Simple tradesmen jumped their counters to become extemporized captains, colonels, and generals, without having ever passed the School of Instruction at West Point; nevertheless; they quickly rivaled their compeers of the old continent, and, like them, carried off victories by dint of lavish expenditure in ammunition, money, and men.

This book provides an extensive survey of all the physics necessary to understand the current developments in the field of fundamental cosmology, as well as an overview of the observational data and methods. It will help students to get into research by providing definitions and main techniques and ideas discussed today. The book is divided into three parts. Part 1 summarises the fundamentals in theoretical physics needed in cosmology (general relativity, field theory, particle physics). Part 2 describes the standard model of cosmology and includes cosmological solutions of Einstein equations, the hot big bang model, cosmological perturbation theory, cosmic microwave background anisotropies, lensing and evidence for dark matter, and inflation. Part 3

describes extensions of this model and opens up current research in the field: scalar-tensor theories, supersymmetry, the cosmological constant problem and acceleration of the universe, topology of the universe, grand unification and baryogenesis, topological defects and phase transitions, string inspired cosmology including branes and the latest developments. The book provides details of all derivations and leads the student up to the level of research articles.

It has been known for a long time that stars are similar to our Sun. But it was only in 1810 that they were shown to be made of an incandescent gas. The chemical composition of this gas began to be determined in 1860. In 1940, it was demonstrated that the energy radiated by the stars is of thermonuclear origin. How stars form from interstellar matter and how they evolve and die was understood only recently, with our knowledge still incomplete. It was also realized recently that close double stars present a wide variety of extraordinary phenomena, which are far from being completely explored. This book explains all these aspects, and also discusses how the evolution of stars determine that of galaxies. The most interesting observations are illustrated by spectacular images, while the theory is explained as simply as possible, without however avoiding some mathematical or physical developments when they are necessary for a good understanding of what happens in stars. Without being a textbook for specialists, this book can be profitably read by students or amateurs possessing some basic scientific knowledge, who would like to be initiated in-depth to the fascinating

world of stars. The author, an emeritus astronomer of the Paris Observatory, worked in various domains of astronomy connected with the subject of this book: interstellar matter and evolution of stars and galaxies. He directed the Marseilles observatory from 1983 to 1988 and served for fifteen years as Chief Editor of the professional European journal *Astronomy & Astrophysics*. He has written many articles and books about physics and astronomy at different levels.

Black holes are undoubtedly one of the most fascinating discoveries of modern astronomy, and their description one of the most daring intellectual feats of modern times. They have already become legendary, forming the basis of many myths, fantasies and science fiction movies. Are they really the monsters which devour light and stars; bottomless celestial pits into which all matter is sucked and crushed? Are they an observable reality, or are they just hypothetical objects from the theory of

relativity? In answering such questions the author takes us on a fabulous journey through space and time. Dr Jean-Pierre Luminet is an astronomer at Meudon Observatory in France, a specialist on the subject of black holes, and has also acquired a reputation for being a gifted writer and communicator. In this book he makes the subject of black holes accessible to any interested reader, who will need no mathematical background.

Published at the height of the McCarthy era, Norman Mailer's audacious novel of socialism is at once an elegy and an indictment, a sinuous moral thriller and an intellectual slugfest. Wounded during World War II, Mike Lovett is an amnesiac, and much of his past is a secret to himself. But when Lovett rents a room in Brooklyn, he finds that his housemates have secrets of their own: One betrays a husband no one ever sees; another may have been a Communist executioner. Combining Kafkaesque unease with Orwellian paranoia, *Barbary Shore* plays havoc with our certainties and delivers its effects with a force that is pure Mailer. Praise for *Barbary Shore* "A work of remarkable power, of amazing penetration, both into people and the determining forces of American life."—*The Atlantic Monthly* "Vibrant with life, abundant with real people . . . [Mailer has] a scintillating skill in observation, a mature sense of meaning."—*The Philadelphia Inquirer* "This book is nothing short of amazing."—*Newsweek* "*Barbary Shore* [is] about the kind of country—and what you might call the psychic territory—that American war heroes were returning to."—*The Guardian* Praise for Norman Mailer "[Norman Mailer] loomed over American letters longer and larger than

any other writer of his generation."—*The New York Times* "A writer of the greatest and most reckless talent."—*The New Yorker* "Mailer is indispensable, an American treasure."—*The Washington Post* "A devastatingly alive and original creative mind."—*Life* "Mailer is fierce, courageous, and reckless and nearly everything he writes has sections of headlong brilliance."—*The New York Review of Books* "The largest mind and imagination [in modern] American literature . . . Unlike just about every American writer since Henry James, Mailer has managed to grow and become richer in wisdom with each new book."—*Chicago Tribune* "Mailer is a master of his craft. His language carries you through the story like a leaf on a stream."—*The Cincinnati Post* *Norman Mailer, the Radical as Hipster* Weidenfeld & Nicolson

A New York Times Notable Book Nobel laureate V. S. Naipaul's impassioned and prescient travelogue of his journeys through his ancestral homeland, with a new preface by the author. Arising out of Naipaul's lifelong obsession and passion for a country that is at once his and totally alien, *India: A Million Mutinies Now* relates the stories of many of the people he met traveling there more than fifty years ago. He explores how they have been steered by the innumerable frictions present in Indian society—the contradictions and compromises of religious faith, the whim and chaos of random political forces. This book represents Naipaul's last word on his homeland, complementing his two other India travelogues, *An Area of Darkness* and *India: A Wounded Civilization*.

Unique in its breadth of coverage and level of presentation, this revised textbook provides more on the nature of

galaxies, extragalactic objects, the large-scale structure of the Universe, and cosmology than is available in general textbooks on astronomy. It remains, however, accessible to advanced undergraduate students. One or more chapters are devoted to each of the following: the classification and morphology of galaxies; the galactic interstellar medium; galactic kinematics; elliptical, spiral, and barred spiral galaxies; the interactions between galaxies; extragalactic radio sources, quasars and their line spectra, and other active galactic nuclei; the formation of galaxies; the Universe as a whole; and cosmology.
